## DETAILED ACTION

### *Claim Rejections - 35 USC § 103*

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Pickover et al. [US. 5,740,390] in view of Fleck [US. 6,160,539].

As to claims 1, 5, 7, 11, 13, 17, 19, 21 and 23, Pickover et al. discloses user controlled means for moving an on-screen pointer to approach said selectable items (column 1, lines 53-65); means for setting a predetermined minimum clearance factor required for user selection of an item by said pointer (column 1, line 65 through column 2, line 43); means for determining whether a selectable item being approached by said pointer has said minimum clearance factor (column 5, line 49 through column 6, line 14); means for determining whether a selectable icon being approached by said pointer is within said minimum clearance distance from said pointer (column 7, lines 1-35); means for determining whether said approached icon has said minimum clearance distance from its adjacent icons (column 5, line 48 through column 6, line 14). The difference between the claim and Pickover et al. is means responsive to a determination that said approached item does not have said minimum clearance factor for reducing the size of said pointer. Fleck shows the feature at column 1, lines 40-67, column 3, lines 25-50 and column 5, lines 10-30, by citing "adjusting the cursor shape being portrayed on display when the pointer is

moved in the menu area from one menu item to another menu item so that the user can determine which menu item the pointer is over without having to look at the tablet surface). It would have been obvious to one of ordinary skill in the art, having the teachings of Pickover et al. and Fleck before him at the time the invention was made to modify the plurality of adjacent icons with a predetermined distance taught by Pickover et al. to include the method of reducing the size of the cursor of the Fleck system, in order to a user to select a desire icon as taught by Fleck.

As to claims 2, 8, 12, Pickover et al. also discloses the items being icons (column 1, line 53 through column 2, line 12).

As to claims 3, 9, 15, Pickover et al. teaches the reduced size pointer has a reduced minimum clearance factor (column 6, line 34 through column 7, line 3).

As to claims 4, 10, 16, Pickover et al. also teaches the minimum clearance factor is defined by: Minimum Clearance =  $d + s$  wherein:  $d$  is the widest visible dimension of the approached icon (column 3, lines 12-35), and  $s$  is the space between the approached icon and the closest adjacent icon in a continuation of the  $d$  dimension line (column 5, line 48 through column 6, line 14).

As to claims 6, 12, 18, Fleck provides reduced size pointer has a reduced minimum clearance distance whereby said approached icon does have said minimum clearance distance from adjacent icons (column 5, lines 10-30, "The user need not look down at the tablet because the cursor shape on the display indicates to the user what menu item the pointer is positioned over for selection").

As to claims 20, 22 and 24, Pickover et al. teaches each item is activated for selection when said dimensions are enlarged (column 5, line 48 through column 6, line 14).
